

ABSTRACT

The present invention provides a novel and non-obvious method and system for administering learning objects within a learning management system. A user can select various learning materials in the system, known as "learning objects", and can aggregate these learning objects in a special category or "learning folder" directly on the system. The user can create and delete learning folders, and can modify each learning folder by adding or removing learning objects to and from the folder. Finally, while each learning folder created by a user can at first only be accessed by the user, a user can allow other learners in the system to access the folder by establishing a "learning link" for the folder, which dictates which other learners can access the learning folder.
